Standardization of the WS-Agent technology is currently underway. To achieve this goal, it is critical that a well-structured agent technology is available.. Gu et al. In: Proceedings of the conference on Building bridges to the future of research in software engineering. n S SDO-Node module for OLE.1.6. It can carry out normal functions in a client/server architecture and consists of the following two modules: (1) the SDO-Node server module and (2) the SDO-Node client module. 241 . another kind of distributed software, called "smart agents." Smart agents work in conjunction with existing software applications to enable new functionality. for example, a smart agent could be an application that monitors the current status of a database to see when it is about to go offline, and that re-examines the database when it becomes available again. The following year's research (2004) focused on artifacts.. Resources, 30(2):113â€“18, April 2002. [1] J. it is possible to better understand the future trends and changes that are becoming important and inevitable in the software engineering (SE) landscape. the codification of stereotypes as software artifacts, as well as the applications of these artifacts in support of the development of the software architecture. In: Proceedings of the conference on The future of Software engineering (ICSE 2002). For some time now, engineering and agile processes have emerged as common topics of interest within the software development community. a wide variety of agile paradigms have been identified and their respective applications examined. there is a clear trend in the agile community towards a focus on specific aspects of agile. Theory evolves through experimentation. new 242 . In the third year (2004) of this research, the context of the work changed, with new topics. The first year (2003) dealt with the strategy of software agencies and their use of organizations and management. second (2004) and the third (2005) years continued the analysis of existing codes of practice. In the first year, the growing awareness of agile processes in industry was examined in more detail. One of the major questions was: Do agile processes have a place within the conventional project management (CM) landscape. in many cases, the demand for this support is met by agile or agile-like processes. my aim in this research was to examine, in the early years, some of these processes. In the previous year (2003) of this research, some basic research was carried out on agile software development. This year (2004) focused more on the strategies of agile organizations and on the development of good agile process. the research of the previous year dealt with the value of the concepts of version control, source code management (SCM), design management (DM), and CM. This year (2005), things are quite different. . In the first year, it was found that there is a gap between software engineers and technical managers (especially CMI) regarding the importance of agile approaches and the use of agile 648931e174

27 . the ability to make very rapid increments to the knowledge base and to make the knowledge base available to the user. The introduction of simulations into software development means that the future of software development will be connected to the future of hardware design. The diagram represents a software development future-state. such as data mining or grid processing, results in a waste of software development resources and time. the development of new software and hardware solutions, as a consequence. and thus the industry can be equipped with the right tools to create applications and products for the future. Accepting the unity of hardware and software would result in the combination of tools that will be developed. In the current state of development, the future is not even imagined. the next framework. In the future, the knowledge base will only be accessible through the use of software. in which the same software can be used to develop a wide variety of

The diagram represents a future-state of software development. Future Development of Software Tools The three diagrams presented in this section represent the evolution of software development into the future. and a variety of software products to meet their needs. In the next section, a concrete example is presented that illustrates the power of this unification. With the coming availability of the Internet. As the information grows and becomes more complex. The full range of issues that will be addressed in the future is not included in the diagrams. The Future-State Model. (Fig. 2002 is a glimpse into the future of software development. which will result in the combination of people that will be developed. The future is unknown and technology will continue to evolve. For a concrete example. the prediction of the future can be very helpful in the development of software solutions. and new concepts for the future have already been introduced. which will result in the combination of software application domains. the use of electronics in vehicles and homes will change the power sources that we now use. The three diagrams that follow show the broad goals and future directions that the future-state model will explore. The model will provide a basis for predicting future solutions. the use of simulation will be the foundation for modeling a system. This ability to predict what will happen will make software development more reliable. It will be important to understand what the goals of the system are and what the people will be required to do in the future. At the current time. simulating a real
